PCT/IB 2003/003346

Box No. V Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. Statement

Novelty (N)	Claims Claims	1-28	YES NO
Inventive step (IS)	Claims Claims	1-28	YES NO
Industrial applicability (IA)	Claims Claims	1-28	YES NO

2. Citations and explanations (Rule 70.7)

The following documents were cited in the International Search Report:

D1: US6385452 B1
D2: WO0235752 A2
D3: US6169899 B1

D1 relates to a telecommunication system for positioning a mobile station in a cellular network. The system comprises location measurement units. The location measurement units are responsible for obtaining positioning measurements and providing these measurements to a serving mobile location centre (SMLC) for use in calculating the location of mobile stations, (column 2 lines 41-54). A location services client (LCS) sends a positioning request to a SMLC, (column 5 lines 44-50). The SMLC has a timer.

D2 relates to a mobile station locating method in a cellular network. A location services arrangement (LSA) sends a request message to the VLR to obtain location information about a mobile station. The location information, subscriber status and the timestamp of the location information are returned to the LSA, (page 6 lines 10-15).

The LSA controls the reply and if it does not meet certain quality criteria then the mobile station is forced into an active mode and the mobile station can be positioned. The quality criteria can be that the information is too old, (page 7 lines 17-19).

.../...

Supplemental Box

In case the space in any of the preceding boxes is not sufficient. Continuation of: Box V.

D3 describes that location information is time-stamped and stored in the VLR. The time-stamp is used to indicate the age of the information. A location application requesting the location information may determine the reliability of the information.

The claimed invention

The present invention relates to a method and apparatuses for providing the location of a mobile station in a mobile communications system. A network element, e.g. an MSC/VLR stores the last known location of each mobile station, together with the time at which that location was determined.

When a network element receives a request to position a mobile station, it is determined whether the mobile station is active or not. If the mobile station is active, the location of the mobile station is known. If the mobile station is idle, the time, stored in the network element, is compared to a threshold time limit. Only when the time is not within the threshold limit is the current location of the mobile station determined. Otherwise, the last determined location is provided.

Reasoned statement

None of the cited documents discloses the claimed invention. However, D2 has a network element, which provides a last known location if the time, at which a last known location of the mobile station was determined, is within a threshold time limit. On the other hand, the network element can not determine the time without polling another network element.

In the cited documents there are no suggestions leading a skilled person in the art to modify the network element in D2 towards the invention according to claims 1-28.

Accordingly, the invention defined in claims 1-28 is novel and is considered to involve an inventive step. The invention is industrially applicable.
